• **Prominent rugae:** This may indicate an abnormally narrow or low palate or both, or an abnormally large tongue in relation to the palatal area. Prominent rugae is also associated with tongue thrust.

• **Short lingual frenulum:** This may result in an articulation disorder, if the client is unable to place the tongue against the alveolar ridge to produce alveolar and alveolar sounds. Therefore, the frenum may need to be clipped by a physician.

Precautions should always be followed to protect all parties from possible contact with body fluids and infectious materials.

- Always include clients, and possibly other staff, are an infectious risk and use appropriate barrier practices, such as:
  - Sterilize all equipment that is used in the mouth.
  - Wash hands before and after contact.
  - Wear gloves if there will be any contact with body fluids, mucous membranes, or broken skin.
  - Remove gloves promptly without touching the outside of them (turn them inside out when removing), and then safely dispose of them.
  - Wash hands after removing gloves.
